Software Development I

1/31/18

The Waterfall method explains the software development process by starting off with the required specifications and goes all the way through the processes until you finally reach the maintenance process. The Agile method takes a similar approach but includes much more maintenance. The Agile method says that the software must be updated and improved constantly. This is unlike the Waterfall method where the software is only improved when there is a problem with it. However, both development processes are similar because they involve the establishment of what software will be created, creating the software, testing it, then releases it and fixing the issues. Lastly, Agile seems to be more for group work and working with business partners. The Waterfall method seems to be more for people to work independently. I believe that Agile is the better option because it involves more maintenance and is better at making sure the software is without error and flows smoothly because of its constant maintenance of it.
